

FONT DISPLAY METHOD USING A FONT DISPLAY CO-PROCESSOR TO ACCELERATE FONT DISPLAY

Abstract

A font display method using a font display co-processor to accelerate font display includes receiving font information from a baseband CPU and loading a mapping table, a font bitmap table, and a font code table to the font display co-processor. The font information is corresponded to a font code according to the font code table. The font code corresponds to a font index according to the mapping table. The font index is corresponded to a font bitmap according to the font bitmap table. Some special effects may be added to the font bitmap displayed on a display module.
